I.Introduction

Corruption remains one of the most persistent obstacles to good governance and national development in the Philippines. It manifests in many forms, including bribery, misuse of public funds, nepotism, fraud in the awarding of government contracts, and abuse of entrusted power. According to the 2025 Corruption Perceptions Index (CPI) published by Transparency International, the Philippines scored only 32 out of 100 and ranked 120th out of 182 countries, reflecting a persistently high perception of corruption in the public sector (Transparency International, 2025).

The scale of public concern is significant. A nationwide survey found that 86% of Filipinos consider government corruption a major problem, underscoring how deeply this issue affects public trust in institutions (Transparency International, 2025). The World Bank likewise notes that weak transparency and accountability mechanisms in public financial management allow corruption to persist despite existing legal safeguards (World Bank, n.d.).

With the growing availability of digital technology, data analytics, and mobile platforms, government processes can be made more transparent, traceable, and open to public scrutiny. Therefore, this project proposes an IT-enabled public fund transparency and citizen reporting platform designed to reduce opportunities for corruption in government transactions and to empower citizens to participate in accountability efforts.

II. Problem Description

Corruption in the Philippines is enabled by the abuse of entrusted power for private gain, commonly taking the form of bribery, misuse of public funds, nepotism, fraud and manipulation of government contracts, and abuse of authority. These practices are often difficult to detect because financial and procurement records are scattered across different agencies, are not always released in a timely or accessible format, and are rarely cross-checked against independent data sources.

The consequences of this problem extend across multiple sectors of society. For ordinary citizens, corruption results in less access to quality public services, as funds intended for infrastructure, health, and education are diverted or misused. For government institutions, it weakens accountability and erodes public trust. For the economy, corruption discourages both local and foreign investment and can slow overall economic growth. For society as a whole, it increases inequality and allows unfair advantages for those with power or connections (Transparency International, 2025; World Bank, n.d.).

A core difficulty is that citizens rarely have an easy way to track how public funds are actually spent, or a safe and convenient channel to report irregularities they observe, such as ghost projects, overpriced contracts, or suspicious procurement awards. Without accessible tools for monitoring and reporting, corruption can continue largely unchecked, and public officials face limited pressure for real-time accountability.

III. Proposed Solution

The proposed solution is an IT-enabled Public Fund Transparency and Citizen Reporting Platform, consisting of a public-facing web dashboard and a companion mobile application. The system is built around three main components.

First, **an open data dashboard** that automatically pulls and consolidates publicly available government procurement and budget data (such as contract awards, project costs, and implementing agencies) into a single, searchable interface. Citizens can look up a specific project, agency, or region and see how funds were allocated and spent, presented through simple charts and summaries rather than raw spreadsheets.

Second, **an anomaly-flagging module** that uses data analytics to compare project costs against historical and regional benchmarks, flagging contracts that appear significantly overpriced, awarded through limited bidding, or repeatedly given to the same contractors. Flagged items are not treated as proof of wrongdoing but as "needs verification" cases that are surfaced for public and journalistic scrutiny, similar in spirit to independent fact-checking processes.

Third, **a secure citizen reporting channel** built into the mobile app, allowing users to anonymously submit reports of suspected corruption, such as ghost projects or solicited bribes, complete with photos or location tags. Reports are encrypted and routed to the appropriate oversight body (e.g., the Office of the Ombudsman or the Commission on Audit), with the reporter's identity protected throughout the process.

Together, these components create a feedback loop: government data becomes easier to monitor, unusual spending patterns are surfaced automatically, and citizens

are given a safe, convenient way to report what they observe on the ground. This shifts part of the burden of oversight from limited government auditors alone to a broader base of informed and engaged citizens.

IV. Conclusion

Corruption in the Philippines is not simply a matter of individual wrongdoing; it is a systemic problem rooted in limited transparency and weak public access to information about how government funds are used. As reflected in the country's persistently low ranking in the Corruption Perceptions Index and the high level of public concern it generates, addressing corruption requires tools that make government spending visible and accountability mechanisms accessible to ordinary citizens.

By combining an open public-fund data dashboard, automated anomaly-flagging, and a secure citizen reporting channel, this project offers a practical, technology-enabled step toward greater transparency and accountability in government transactions. As an engaged member of society, I recognize that meaningful reform depends not only on stronger laws but also on giving citizens the tools to see, question, and report how public resources are managed. This platform is intended to support that goal by making accountability a shared, everyday practice rather than an occasional investigation.
